

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing Of Claims:

Please amend the claims as follows:

1. (Previously Presented) A job execution control apparatus, comprising:

an execution section that executes a plurality of jobs in a parallel manner;

a setting section that allows a user to set a pause condition for each job kind and a stop condition for each job kind;

a storage section that stores the pause condition set by the setting section;

a controller, wherein when a button is depressed, the controller makes a first job, which is being executed by the execution section and satisfies the pause condition, pause and stop and delete a second job, which is being executed by the execution section and satisfies the stop condition;

a display that displays the pausing jobs made to pause by the controller; and

a specifying section that specifies at least one job among the pausing jobs displayed on the display.

2. (Previously Presented) The job execution control apparatus as set forth in claim 1, further comprising a stopping section that stops the specified job.

3. (Previously Presented) The job execution control apparatus as set forth in claim 1, further comprising a restarting section that restarts the specified job.
4. (Cancelled)
5. (Previously Presented) The job execution control apparatus as set forth in claim 1, wherein the setting section allows the user to set a parameter of a job as the pause condition.
6. (Previously presented) The job execution control apparatus as set forth in claim 1, wherein the display displays only the pausing job.
7. (Previously presented) The job execution control apparatus as set forth in claim 1, wherein the display displays jobs other than the pausing job.
8. (Cancelled)
9. (Previously Presented) The job execution control apparatus as set forth in claim 1, wherein the setting section further allows the user to set an additional condition under which the job pauses in addition to the pause condition.

10. (Original) The job execution control apparatus as set forth in claim 9, wherein the additional condition is defined by such a fact as to whether the job corresponds to a background job, or a foreground job.

11. (Previously Presented) A job execution control apparatus comprising:
an execution section that specifies a plurality of jobs in a parallel manner;
a storage section that stores a first condition satisfied by a job which is stopped and deleted without any restriction in response to a predetermined event and a second condition satisfied by a job which is paused in response to the predetermined event;
a stop section that stops and deletes the job satisfying the first condition in response to the predetermined event;
a pause section that makes a job, which is being executed by the execution section and satisfies the second condition pause in response to the predetermined event;
a display that displays the pausing jobs made to pause by the pause section; and
a designation section that designates at least one job from the pausing jobs to be stopped and deleted, or restart the designated job.

12. (Cancelled)

13. (Previously presented) A job execution control apparatus according to claim 1, wherein the predetermined event is an operation of a predetermined key provided on a portion except for the display.

14. (Cancelled)

15. (Previously Presented) A job execution control apparatus according to claim 1, wherein the storage section further stores an attribute of a job which is directed to a pausing job.

16. (Previously Presented) A job execution control apparatus according to claim 1, further comprising:

a notifying section that notifies at least an identifier of the pausing job to an instruction apparatus; and

stopping section that stops and deletes at least one job instructed by the instruction apparatus among the pausing jobs.

17. (Previously Presented) A job execution control apparatus according to claim 1, wherein the display is provided with a touch panel function for displaying information related to one job that is being executed.

18. (Previously Presented) A document processing job execution control apparatus, comprising:

an execution section that executes a plurality of document processing jobs including a copy job, a print job, and a facsimile job in a parallel manner;

a setting section that allows a user to set a pause condition for each job kind and a stop condition for each job kind except for a facsimile job;

a storage section that stores the pause condition set by the setting section;
a controller, wherein when a button is depressed, the controller makes a first job, which is being executed by the execution section and satisfies the pause condition, pause and stop and delete a second job, which is being executed by the execution section and satisfies the stop condition;
a display that displays the pausing jobs made to pause by the controller;
a specifying section that specifies at least one job among the pausing jobs displayed on the display, and
a stop section that stops and deletes the specified job specified by the specifying section.

19. (Previously Presented) A document processing job execution control apparatus comprising:

a plurality of document processing jobs including a copy job, a print job, and a facsimile job in a parallel manner;
a setting section that allows a user to set a pause condition for each job kind and a stop condition for each job kind except for a facsimile job;
a storage section that stores a first condition satisfied by a job which is stopped and deleted without any restriction in response to a predetermined event and a second condition satisfied by a job which pauses in response to the predetermined event;
a stop section that stops and deletes the job satisfying the first condition in response to the predetermined event;

a pause section that makes a job, which is being executed by the execution section and satisfies the second condition pause in response to the predetermined event;
a display that displays the pausing jobs made to pause by the pausing section; and
a specifying section that specifies at least one job among the pausing jobs displayed on the display, wherein the stop section stops and deletes the job specified by the specifying section.

20. (Previously Presented) A document processing job execution control apparatus according to claim 18, wherein the storage section further stores an attribute of a job which is directed to a pausing job.

21. (Canceled)

22. (Previously Presented) A job execution method comprising the:
executing a plurality of jobs in a parallel manner;
stopping and deleting a first job satisfying a predetermined first condition in response to a predetermined event;
making a second job, which is being executed and satisfies a predetermined second condition pause in response to the predetermined event;
displaying at least the pausing job;
specifying at least one job among the displayed jobs; and
stopping and deleting the specified job.

23. (Previously Presented) A job execution control apparatus in accordance with claim 1, wherein said predetermined event includes an instruction input operation of a user.

24. (Previously Presented) A job execution control apparatus in accordance with claim 11, wherein said predetermined event includes an instruction input operation of a user.

25. (Previously Presented) A document processing job execution control apparatus in accordance with claim 18, wherein said predetermined event includes an instruction input operation of a user.

26. (Previously Presented) A document processing job execution control apparatus in accordance with claim 19, wherein said predetermined event includes an instruction input operation of a user.

27. (Canceled)

28. (Previously Presented) A job execution method in accordance with claim 22, wherein said predetermined event includes an instruction input operation of a user.
